# Exercise 1: Handling ZeroDivisionError
```

```
def safe_divide(numerator, denominator):  
    try:  
        result = numerator / denominator  
        return result  
    except ZeroDivisionError:  
        print("Error: Cannot divide by Zero.")  
        return None  
numerator = float(input("Enter the numerator: "))  
denominator = float(input("Enter the denominator: "))  
result = safe_divide(numerator, denominator)  
if result is not None:  
    print("Result:", result)          float: denominator
```

```
Enter the numerator: 12          6.0  
Enter the denominator: 6  
Result: 2.0
```

```
# Exercise 2: Handling ValueError
```

```
import math  
def calculate_square_root(number):  
    try:  
        if number < 0:  
            raise ValueError  
  
        result = math.sqrt(number)  
        return result  
  
    except ValueError:  
        print("Invalid input! Please enter a positive integer or a float value.")  
        return None  
number = float(input("Enter a number: "))  
result = calculate_square_root(number)  
if result is not None:  
    print("Square root:", result)
```

```
Enter a number: 225  
Square root: 15.0
```

```
# Exercise 3: Handling Generic Exceptions
```

```
def calculate(num):  
    try:  
        result = num / (num - 5)  
        print("Result:", result)  
        return result  
  
    except Exception as e:  
        print("An error occurred during calculation.")  
        return None  
num = float(input("Enter a number: "))  
result = calculate(num)
```

Enter a number: 10
Result: 2.0

float: denominator
6.0
